

reversing everything with claude code

Zane St. John

about me

- tl;dr I like breaking things (responsibly)
- Class of '27, SymSys
- Creative technologist with an interest in cybersecurity
- Worked in a variety of spaces including web3, AI/RAG for gov't, experiential design
- I also know some Applied Cyber people
 - Former participant in Stanford Bug Bounty (iykyk)
 - Love you all fr

claude code

- Powerful agentic orchestration layer built on top of Claude models
- Built-in prompts and tools expose command-line capabilities, web search, data connectors (MCP)
- Highly capable beyond standard SWE: writing & analysis, data processing, reverse engineering?

*I will sometimes abbreviate it as **CC**.*

```
[zanestjohn@Zanes-MacBook-Pro-3 hello-applied-cyber % claude ]
```

```
Claude Code
```

```
Welcome back Zane!
```

```
Opus 4.5  
Claude Max  
~/hello-applied-cyber
```

```
>  try "how do I log an error?"
```

```
▶▶ accept edits on (shift+tab to cycle)
```

why?

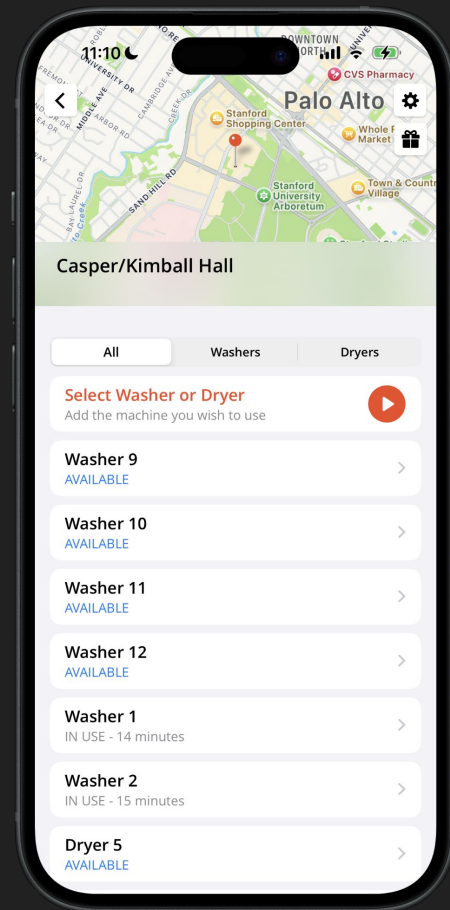

why?

- Reduce RE fatigue → LLMs do the “dirty work”
 - Static analysis without the stress?
- Agentic tooling → test protocols and APIs without human intervention
 - Sub-agents → potentially test multiple strategies in parallel
- Reduce man-hours → save time and money
 - (CC starts at \$20/mo, scaling up to \$100 or \$200 plans for more extensive use)

warmup: a washing machine

motivation

- Washing machines around campus can be monitored via **Speed Queen** app
- However, app does not show how long a machine has been done
- In a crowded dorm like mine (Kimball), people throw people's laundry out so theirs can go in
- **Goal: Find out which machines have been sitting the longest**

easy: a fire tv

motivation

- Fire TV allows local control over network via proprietary mobile app
- API is undocumented but extremely useful to open-source community
- Potential use in smart home automation, control systems, and FOSS apps

process

- Open Fire TV app on mitmproxy-proxied phone
- Click around in the Fire TV remote to record various request types
- Save the output of this session to a `.mitm` dump file
- **Ask Claude Code to:**
 - Read this dump, infer API, and write documentation
 - Write a library & demo program in Python

outcome

- **Protocol documentation** → API docs for an otherwise undocumented API
- **Working library and demo** → control Fire TV programmatically
- My application: Used Claude-generated protocol docs to develop Fire TV driver for home theater
 - (Yes, even the driver was written by Claude Code!)

hard: a printer

motivation

- Kodak STEP printer and similar printers available for (relatively) low price
- Most of these printers require proprietary app to send photos over Bluetooth
- No documented API, few efforts to reverse-engineer
- **Goal: Print programmatically and without using the app**

small problem

- My laptop runs macOS, which has poor support for RFCOMM, the Bluetooth protocol used to communicate with the printer
- This creates two challenges:
 1. CC can't write code that allows my computer to print directly
 2. CC agent can't communicate directly with the printer to investigate its capabilities
- **Solution: ESP32 as Proxy**

hard(er?): a projector

motivation

- Proliferation of inexpensive, Android-based projector on AliExpress, Temu, TikTok Shop
- Cheap hardware and misleading claims
- Rumors of surreptitiously malicious behavior

- **Can we use CC to find the malware?**
- **Can CC determine how the malware works?**

what we found

package	purpose
com.hotack.silentsdk	Remote Access Trojan (RAT)
com.htc.eventuploadservice	Detailed event logging
com.htc.expandsdk	Ad injection + potential malware persistence
com.htc.htcotaupdate	OTA updates over HTTP

OVERVIEW	PAYLOAD
#1 [TX] 14:57:06.159 – 31 B

what did we learn?

takeaways

- Keep scope narrow and targeted
- Outline specific goals
- Expose devices, protocols, and APIs with MCPs & CLIs
- Encourage to-do list generation, multi-agent use, **ultrathink**

reminders

- Act responsibly when conducting good-faith security research
- Responsible disclosure – report vulnerabilities as they are found
- Do not break the law!!!

future steps

- Expanded RE-ing of binaries with LLM tooling
 - [ghidraMCP](#), [Frida MCP](#), etc.
- Explore Claude's safeguards and their limits
- Experiment with computer use for greater agent autonomy
- *For me: try RE-ing with other agents*
 - (Codex?)
